

## Meeting Recap:

Build a web app called 'MeetingRecap AI'. User Input: The interface should have one large text area where a user can paste a raw meeting transcript. AI Processing: When 'Summarize' is clicked, the AI must process the transcript to do the following: a. Generate a concise, one-paragraph summary of the meeting's key discussion points. b. Identify and extract all clear action items, assigning each to the person mentioned. c. List all key decisions that were made. Output: Display the Summary, Action Items, and Key Decisions in three separate, clearly labeled sections. Include a 'Copy to Clipboard' button for the entire output.
